

Warning about fake LSD

Current batches of LSD tabs might contain a dangerous chemical that can lead to fatal overdose.

The chemical, called NBOMe, can come on slower, so the LSD might feel like it is not working. Topping up could lead to a fatal overdose.

If you are still determined to use, but not 100% sure about the LSD you have bought:

- Only take a $\frac{1}{4}$ dose and wait 1.5 hours before considering taking any more.

- Don't take multiple tabs unless you are 100% sure that you are taking LSD.

- Never use alone - always use LSD with somebody who can provide support if needed.

- Make sure you're in the right head space.
